Visa Threat Intelligence

Essential cybersecurity intelligence for payment data.

Visa Threat Intelligence is an essential enterprise security offering for businesses that accept, store and process payment data. Visa Threat Intelligence provides high-quality, low-false-positive and breach-validated Indicators of Compromise (IoC), along with expertly curated threat analysis, to help security operations detect and protect against attacks targeting payment data.

Visa Threat Intelligence helps level the playing field by providing payment focused cyber intelligence to address challenges faced by merchants.
Thousands of potential threats	Increasingly sophisticated attackers	Shifting organizational security strategies	A rapidly expanding attack surface

VISA

Why Visa Threat Intelligence?

Visa Threat Intelligence leverages Visa's unparalleled visibility into fraud and payment breaches to protect not just payments and transactions, but also the merchant network and the data it contains.

Superior data

85% of Visa Threat Intelligence's threat indicators are unique[1]—providing your business with a powerful and efficient tool for breach detection and prevention that cannot be sourced from other intelligence offerings.

Superior intel

Visa IoC's are focused on payment related threats and are derived from known breach activity. Our focus solves a specific challenge for merchants by reducing data overload and the number of false positives associated with broad paid and open source intelligence feeds.
Superior efficiency

Visa Threat Intelligence powers your existing security operation to work smarter with less manual effort and requires no additional hardware or software. Simply connect with our API to receive timely and actionable IOCs to help defend against cyberattacks.

How it works

Visa Threat Intelligence data will soon be available as a set of APIs that are compatible with all major cybersecurity hardware, software and intrusion detection and prevention systems. Supported formats will include JSON, CSV, and STIX.

Visa Threat Intelligence's API allows programmatic integration with existing security infrastructure, providing accurate and unique IoC of known malicious actors—and enabling prompt detection of the latest and most sophisticated threats.

Visa Threat Intelligence partners

SafeBreach simulates hacker breach methods to weaponize Visa Threat Intelligence IoC—offering specific guidance on weaknesses in enterprise defenses and how attackers might exploit them.

Centripetal Networks' QuickThreat platform bolsters your network intelligence by synchronizing Visa Threat Intelligence IoC with other threat data to alert and block at the network perimeter.
